

# EODHD — free data sample & what it contains (for SBI)

17 Jun 2026 · evaluation for the platform

## Key finding: Indian stocks need a registered key

- Requesting **SBIN.NSE** with EODHD's free demo token returns "**Forbidden**". The demo token only covers a few US tickers (AAPL.US, TSLA.US...).
- To pull **SBI (SBIN.NSE)** we need an EODHD API key — a **free account issues one** (limited daily calls), or a paid plan for full access.
- The samples below use **AAPL.US (demo)** to show the **exact structure** you'd get for SBI — the fields are identical; only the symbol and values change.

## What EODHD provides (by data type)

### 1. End-of-day history — the multi-year series

Fields: date, open, high, low, close, adjusted\_close, volume. (adjusted\_close is split/dividend-adjusted — important for clean multi-year charts.) Example (AAPL):

|            |      |        |      |        |     |        |       |        |        |            |
|------------|------|--------|------|--------|-----|--------|-------|--------|--------|------------|
| 2026-06-09 | open | 300.28 | high | 300.75 | low | 287.78 | close | 290.55 | volume | 70,108,800 |
| 2026-06-10 | open | 290.74 | high | 294.75 | low | 287.38 | close | 291.58 | volume | 52,793,300 |

### 2. Live / real-time quote

Fields: code, timestamp, open, high, low, close, volume, previousClose, change, change\_p.

### 3. Fundamentals — rich and nested

Top-level sections returned: **General** · **Highlights** (MarketCap, P/E, PEG, EBITDA, WallStreetTargetPrice) · **Valuation** (Trailing/Forward P/E, P/S, P/B, EnterpriseValue) · **SharesStats** · **Technicals** (Beta, 52-week high/low, 50- & 200-day MA) · **SplitsDividends** (dividend rate/yield, payout, ex-date) · **AnalystRatings** (Rating, TargetPrice, Buy/Hold/Sell counts) · **Holders** · **ESGScores** · **Earnings** (History/Trend/Annual) · **Financials** (full Balance Sheet, Cash Flow, Income Statement).

### 4. News + built-in sentiment

Fields: date, title, content, link, symbols, tags, sentiment. Sentiment is scored (polarity / neg / neu / pos) — ready to feed the news-scraping requirement and the model.

## The one gap: delivery data (dad's core metric)

- EODHD's EOD record has **volume but NO delivery quantity / delivery %** (confirmed — no delivery field).
- **Delivery %** → source free from **NSE sec\_bhavdata\_full bhavcopy** (daily + historical archives).
- **F&O / OI** (flagged important) → free from **NSE F&O bhavcopy** (EODHD also has options data on higher tiers).

## Bottom line

EODHD covers **prices + fundamentals + news + sentiment** very well, India included (with a key). Pair it with **free NSE bhavcopy** for **delivery % + F&O/OI**, and the data layer covers everything on dad's list.

## Next step to get a real SBI sample

Create a **free EODHD account** (it issues an API key) and share the key with me — or approve a paid plan — and I'll immediately pull **SBIN.NSE** and show the same fields populated with SBI's actual numbers (and a matching NSE delivery-% sample).
